## Abstract

Consider the below mentioned equation:

$$
\begin{equation*}
\left[a^{n}+b^{n}+c^{n}+d^{n}+e^{n}+f^{n}\right]=\left[p^{n}+q^{n}+r^{n}+s^{n}+t^{n}+u^{n}\right] \tag{A}
\end{equation*}
$$

Historically in math literature there are instances where solutions have been arrived at by different authors for equation (A) above. Ref.no. (1) by A. Bremner \& J. Delorme and Ref. no. (10) by Tito Piezas. The difference is that this article has done systematic analysis of equation (A) for $n=2,3,4,5,6,7,8 \& 9$. While numerical solutions for equation (A) is available on "Wolfram math" website, search for parametric solutions to equation (A) in various publications for all $n=2,3,4,5,6,7,8$ \& 9 did not yield much success. The authors of this paper have selected six terms on each side of equation (A) since the difficulty of the problem increases every time a term is deleted on each side of equation (A). The authors have provided
parametric solutions for equation (A) for $n=2,3,4,5 \& 6$ and for $n=7,8 \& 9$ solutions using elliptical curve theory has been provided. Also we would like to mention that solutions for $n=7,8 \& 9$ have infinite numerical solutions.

## Keywords: Pure math, Diophantine equations, Equal sums, parametric solutions

## Degree two, $\mathrm{n}=2$

$$
\begin{equation*}
a^{2}+b^{2}+c^{2}+d^{2}+e^{2}+f^{2}=p^{2}+q^{2}+r^{2}+s^{2}+t^{2}+u^{2} \tag{1}
\end{equation*}
$$

We have the below mentioned numerical solution:

$$
(1,30,31,36,7,17)^{2}=(3,4,19,27,34,35)^{2}
$$

In the above let $a=1, b=30 \& c=31$, Since $1+30=31$ or $(a+b=c)$
Hence we have $\left(a^{2}+b^{2}+c^{2}\right)=2\left(a^{2}+a b+b^{2}\right)$
Let $a=(30+t)$ and $b=(1+k t)$.Substituting for $(a, b) \&$ solving for ${ }^{\prime} t^{\prime}$ in $\left(a^{\wedge} 2+a b+b^{\wedge} 2\right)$ in right hand side of equation (2) above, we get parameterization of (a \& b) given below.
$\mathrm{a}=\left(30 k^{2}-2 k-31\right) /\left(k^{2}+k+1\right)$
$\mathrm{b}=\left(-31 k^{2}-60 k+1\right) /\left(k^{2}+k+1\right)$
$\mathrm{c}=a+b=\left(-k^{2}-62 k-30\right) /\left(k^{2}+k+1\right)$
Also since $(a, b, c)^{2}=(p, q, r, s, t, u)^{2}-(d, e, f)^{2}$, after substituting above values of ( $a, b, c$ ) we get the below mentioned parameterization of equation (A) for degree two.

$$
\begin{aligned}
& \left(30 k^{2}-2 k-31\right)^{2}+\left(-31 k^{2}-60 k+1\right)^{2}+\left(-k^{2}-62 k-30\right)^{2}+ \\
& \left(36^{2}+7^{2}+17^{2}\right) *\left(k^{2}+k+1\right)^{2} \\
& =\left(3^{2}+4^{2}+19^{2}+27^{2}+34^{2}+35^{2}\right) *\left(k^{2}+k+1\right)^{2}
\end{aligned}
$$

For $\mathrm{k}=2$ we get the below mentioned new numerical solution:

$$
(85,158,243,252,49,119)^{2}=(21,28,133,189,238,245)^{2}
$$

## Degree three, $n=3$,

First method:

$$
\begin{equation*}
a^{3}+b^{3}+c^{3}+d^{3}+e^{3}+f^{3}=p^{3}+q^{3}+r^{3}+s^{3}+t^{3}+u^{3} \tag{3}
\end{equation*}
$$

Let $(a, b, c, d, e, f)=[(A x+1),(B x+1),(C x+1),(D x+1),(E x+1),(F x+1)]$
and
$(p, q, r, s, t, u)=[(P x+1),(Q x+1),(R x+1),(S x+1),(T x+1),(U x+1)]$
Let $(A, B, C, D, E, F)^{3}=(P, Q, R, S, T, U)^{3}-----(4)$ be known solution
We have numerical solution, $(1,2,4,8,9,12)^{3}=(3,5,6,7,10,11)^{3}$
Substituting values of ( $a, b, c, d, e, f) \&(p, q, r, s, t, u)$ in equation (3) above we get after simplification the below mentioned condition, $x=-\frac{[(A+B+C+D+E+F)-(P+Q+R+S+T+U)]}{W}$

Where, $\mathrm{W}=\left(P^{2}+Q^{2}+R^{2}+S^{2}+T^{2}+U^{2}\right)-\left(A^{2}+B^{2}+C^{2}+D^{2}+E^{2}+F^{2}\right)$
After substituting values of $(A, B, C, D, E, F)$ and $(P, Q, R, S, T, U)$
in equation (5) we get the solution $x=-(1 / 5)$
Hence substituting values of ( $\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}, \mathrm{E}, \mathrm{F}$ ) and ( $P, Q, R, S, T, U$ ) in equation (3) above we get for $x=(-1 / 5)$,

$$
\begin{aligned}
& {[(x+1),(2 x+1),(4 x+1),(8 x+1),(9 x+1),(12 x+1)]^{3}=} \\
& \quad[(3 x+1),(5 x+1),(6 x+1),(7 x+1),(10 x+1),(11 x+1)]^{3}
\end{aligned}
$$

Substituting $x=(-1 / 5)$ we get,

$$
(-4,-3,-1,3,4,7)^{3}=(-2,0,1,2,5,6)^{3}
$$

Similarly for different numerical solutions for equation (4) we can get another value of ' $x$ ' from equation (5) and thus more numerical solutions.

Second Method:

$$
a^{3}+b^{3}+c^{3}+d^{3}+e^{3}+f^{3}=p^{3}+q^{3}+r^{3}+s^{3}+t^{3}+u^{3}---(3)
$$

Let $(a, b, c, d, e, f)=[(A x+1),(B x-1),(C x+1),(D x-1),(E x+1),(F x-1)]$
\&
$(p, q, r, s, t u)=[(A x-1),(B x+1),(C x-1),(D x+1),(E x-1),(F x+1)]$
Substituting values of (a,b,c,d,e,f) \&(p,q,r,s,t,u) in equation (3) above we get after simplyfication the below mentioned condition,
$\left(A^{2}+C^{2}+E^{2}\right)=\left(B^{2}+D^{2}+F^{2}\right)$
Equation (4) has the numerical solution, $\quad(A, C, E)=(2,10,21) \&(B, D, F)=(5,6,22)$
Hence substituting values of (A, B, C, D, E, F) we get the parametric form given below,

$$
\begin{aligned}
& {[(2 x+1),(5 x-1),(10 x+1),(6 x-1),(21 x+1),(22 x-1)]^{3}=} \\
& {[(2 x-1),(5 x+1),(10 x-1),(6 x+1),(21 x-1),(22 x+1)]^{3}}
\end{aligned}
$$

For $\mathrm{x}=1$ we get,

$$
(3,4,5,11,22,21)^{3}=(1,6,9,20,7,23)^{3}
$$

## Degree four, $n=4$,

$$
\begin{equation*}
a^{4}+b^{4}+c^{4}+d^{4}+e^{4}+f^{4}=p^{4}+q^{4}+r^{4}+s^{4}+t^{4}+u^{4} \tag{5}
\end{equation*}
$$

We have numerical solution given below,

$$
(16,480,496,532,798,1330)^{4}=(342,336,224,560,9501292)^{4}
$$

In the above let $a=16, b=480, c=496$. Since $(16+480=496)$ or $(a+b=c)$
So we have $\left(a^{4}+b^{4}+c^{4}\right)=a^{4}+b^{4}+(a+b)^{4}=2\left(a^{2}+a b+b^{2}\right)^{\wedge} 2----(6)$
Let $a=480+t$ and $b=16+k t$
Hence parameterization $\left(a^{2}+a b+b^{2}\right)$ on the right hand side of equation (6) we get $\mathrm{a}=\left(496 k^{2}+960 k-16\right) /\left(k^{2}+k+1\right)$
$\mathrm{b}=\left(-16 k^{2}-992 k-480\right) /\left(k^{2}+k+1\right)$

$$
\mathrm{c}=\left(480 k^{2}-32 k-496\right) /\left(k^{2}+k+1\right)
$$

$$
\text { Since }(a, b, c)^{4}=(16,480,496)^{4}=(342,336,224,560,9501292)^{4}-(532,798,1330)^{4}
$$

After substituting for ( $a, b, c$ ) we get the below mentioned parameterization,

$$
\begin{aligned}
& {\left[\left(496 k^{2}+960 k-16\right)^{\wedge} 4+\left(-16 k^{2}-992 k-480\right)^{\wedge} 4+\left(480 k^{2}-32 k-496\right)^{\wedge} 4+\right.} \\
& \begin{array}{c}
\left(532^{4}+798^{4}+\right. \\
\left.1330^{4}\right) *\left(k^{2}+k+1\right)^{\wedge} 4= \\
\left(342^{4}+336^{4}+224^{4}+560^{4}+950^{4}+1292^{4}\right)^{*}\left(k^{2}+k+1\right)^{\wedge} 4
\end{array}
\end{aligned}
$$

For $\mathrm{k}=2$ we get,

$$
(1944,1264,680,1862,2793,4655)^{4}=(1197,3325,1176,4522,784,1960)^{4}
$$

## Degree five, $n=5$,

$$
\begin{equation*}
a^{5}+b^{5}+c^{5}+d^{5}+e^{5}+f^{5}=p^{5}+q^{5}+r^{5}+s^{5}+t^{5}+u^{5} \tag{7}
\end{equation*}
$$

Consider equation $a^{5}+b^{5}+c^{5}+d^{5}+e^{5}+f^{5}=2(t)^{5}-----(8)$
Let,
$\mathrm{a}=A m^{2}+U m+3 \mathrm{~B}$
$\mathrm{b}=B m^{2}-U \mathrm{~m}+3 \mathrm{~A}$
$\mathrm{c}=\mathrm{Cm}^{2}+\mathrm{Vm}+3 \mathrm{D}$
$\mathrm{d}=D m^{2}-\mathrm{Vm}+3 \mathrm{C}$
$\mathrm{e}=E m^{2}+\mathrm{Wm}+3 \mathrm{~F}$
$\mathrm{f}=F m^{2}-\mathrm{Wm}+3 \mathrm{E}$
$\mathrm{t}=\mathrm{T} m^{2}+3 \mathrm{~T}$
Substituting the values of ( $a, b, c, d, e, f$ ) in equation (8) above we get,

$$
\begin{aligned}
& \left(A m^{2}+u m+3 B\right)^{5}+\left(B m^{2}-u m+3 A\right)^{5}+\left(C m^{2}+u m+3 D\right)^{5}+ \\
& \left(D m^{2}-v m+3 C\right)^{5}+\left(E m^{2}+w m+3 F\right)^{5}+\left(F m^{2}-w m+3 E\right)^{5}=
\end{aligned}
$$

$$
\begin{equation*}
2(T)^{5} *\left(m^{2}+3\right)^{5} \tag{9}
\end{equation*}
$$

We have known solution given below,

$$
(A, B, C, D, E, F)^{5}=(91,7,-21,119,161,-63)^{5}=2 *(147)^{5}=2 *(T)^{5}
$$

Since in equation (9) we have the parameter ' $m$ ', so when we substitute values of ((A,B,C,D,E,F) in equation (9), the only unknowns are ( $u, v, w$ ) , after simplification of equation (9) we get the below conditions,
$(U+V+W)=4(D-F) \quad \&$
$\mathrm{U}=2(\mathrm{D}-\mathrm{F})$
$V=2(2 D-3 B+F)$
$W=2(-D+3 B-2 F)$
Since $(D, B, F)=(119,7,-63)$ we get $(U, V, W)=(364,308,56)$
Substituting the values of ( $A, B, C, D, E, F, U, V, W, T$ ) in equation (9) above we get the below mentioned parameterization,

$$
\begin{gather*}
\left(91 m^{2}+364 m+21\right)^{5}+\left(7 m^{2}-364 m+273\right)^{5}+\left(-21 m^{2}+308 m+357\right)^{5}+ \\
\left(119 m^{2}-308 m-63\right)^{5}+ \\
\left(161 m^{2}+56 m-189\right)^{5}+\left(-63 m^{2}-56 m+483\right)^{5}=2(147)^{5} *\left(m^{2}+3\right)^{5}--------(1 \tag{10}
\end{gather*}
$$

We also have the below mentioned numerical solution,

$$
\begin{aligned}
& (91,7,-21,119,161,-63)^{5}=2 *(147)^{5} \text { and } \\
& (159,-61,127,-29,81,17)^{5}=2 *(147)^{5}
\end{aligned}
$$

Using the new values (159,-61,127,-29,81,17) in place of ( $A, B, C, D, E, F$ ) in equation (9) we get another set of values for $(U, V, W)=(-92,284,-376)$

Substituting the above values in equation (9) we get another parametric equation given below,

$$
\left(159 m^{2}-92 m-183\right)^{5}+\left(-61 m^{2}+92 m+477\right)^{5}+\left(127 m^{2}+284 m-87\right)^{5}+
$$

$$
\begin{gathered}
\left(-29 m^{2}-284 m+381\right)^{5}+\left(81 m^{2}-376 m+51\right)^{5}+\left(17 m^{2}+376 m+243\right)^{5} \\
=2(147)^{5} *\left(m^{2}+3\right)^{5}----(11)
\end{gathered}
$$

Since the right hand sides of equations (10) \& (11) are equal, hence we can equate their left hand sides and we get the below mentioned (5-6-6) equation for degree $n=5$.

$$
\begin{gathered}
\left(91 m^{2}+364 m+21\right)^{5}+\left(7 m^{2}-364 m+273\right)^{5}+\left(-21 m^{2}+308 m+357\right)^{5} \\
+\left(119 m^{2}-308 m-63\right)^{5}+ \\
\left(161 m^{2}+56 m-189\right)^{5}+\left(-63 m^{2}-56 m+483\right)^{5}= \\
\left(159 m^{2}-92 m-183\right)^{5}+\left(-61 m^{2}+92 m+477\right)^{5}+ \\
\left(127 m^{2}+284 m-87\right)^{5}+\left(-29 m^{2}-284 m+381\right)^{5}+\left(81 m^{2}-376 m+51\right)^{5}+ \\
\left(17 m^{2}+376 m+243\right)^{5}
\end{gathered}
$$

For $m=2$ we get,

$$
(1113,377,889,303,567,119)^{5}=(269,417,989,203,427,1063)^{5}
$$

## Degree six, $\mathrm{n}=6$,

There are parameter solutions to,
$\mathrm{A}_{1}{ }^{6}+\mathrm{A}_{2}{ }^{6}+\mathrm{A}_{3}{ }^{6}+\mathrm{A}_{4}{ }^{6}+\mathrm{A}_{5}{ }^{6}+\mathrm{A}_{6}{ }^{6}=\mathrm{B}_{1}{ }^{6}+\mathrm{B}_{2}{ }^{6}+\mathrm{B}_{3}{ }^{6}+\mathrm{B}_{4}{ }^{6}+\mathrm{B}_{5}{ }^{6}+\mathrm{B}_{6}{ }^{6}$
Let,

$$
\begin{aligned}
& A_{1}=a_{1} a+b_{1} b-c_{1} \\
& A_{2}=a_{3} a+c_{3} \\
& A_{3}=a_{4} a+c_{4} \\
& A_{4}=a_{1} a-b_{2} b+c_{2} \\
& A_{5}=a_{2} a-b_{1} b+c_{2} \\
& A_{6}=a_{2} a+b_{2} b+c_{2} \\
& B_{1}=a_{1} a+b_{1} b+c_{1} \\
& B_{2}=a_{3} a-c_{3} \\
& B_{3}=a_{4} a-c_{4} \\
& B_{4}=a_{1} a-b_{2} b-c_{2} \\
& B_{5}=a_{2} a-b_{1} b-c_{2} \\
& B_{6}=a_{2} a+b_{2} b-c_{2}
\end{aligned}
$$

$$
\mathrm{a}_{2}=\mathrm{ma}_{1}, \mathrm{a}_{3}=\mathrm{na}_{1}, \mathrm{a}_{4}=\mathrm{pa}_{1}, \mathrm{c}_{1}=\mathrm{q} \mathrm{c}_{2}, \mathrm{c}_{3}=\mathrm{rc}_{2}, \mathrm{c}_{4}=\mathrm{tc}_{2}
$$

As for this equation (2), the factorization is done as follows.

```
\((m, n, p, q, r, t)=(3,1,-1,-2,-6,3)\)
\(240 a_{1} a c_{2}\left(19 c_{2}{ }^{2}+b_{2}{ }^{2} b^{2}+2 a_{1} b_{2} b a+4 a^{2} a_{1}{ }^{2}\right)^{*}\left(21 c_{2}{ }^{2}+b_{2}{ }^{2} b^{2}+2 a_{1} b_{2} b a+6 a^{2} a_{1}{ }^{2}\right)\)
\((m, n, p, q, r, t)=(3,1,-1,-1,-5,3)\)
\(240 a_{1} a c_{2}\left(14 c_{2}{ }^{2}+6 a_{1}{ }^{2} a^{2}+2 b_{2} b a_{1} a+b_{2}{ }^{2} b^{2}\right)^{*}\left(-12 c_{2}{ }^{2}+4 a_{1}{ }^{2} a^{2}+2 b_{2} b a_{1} a+b_{2}{ }^{2} b^{2}\right)\)
\((m, n, p, q, r, t)=(3,1,-1,2,-2,3)\)
\(240 a_{1} a c_{2}\left(5 c_{2}{ }^{2}+b_{2}{ }^{2} b^{2}+2 a_{1} a b_{2} b+6 a_{1}{ }^{2} a^{2}\right)^{*}\left(-3 c_{2}{ }^{2}+b_{2}{ }^{2} b^{2}+2 a_{1} a b_{2} b+4 a_{1}{ }^{2} a^{2}\right)\)
\((m, n, p, q, r, t)=(3,1,-1,3,-3,1)\)
\(240 a_{1} a_{2}\left(6 c_{2}{ }^{2}+b_{2}{ }^{2} b^{2}+2 a_{1} a b_{2} b+6 a^{2} a_{1}{ }^{2}\right)^{*}\left(-4 c_{2}{ }^{2}+b_{2}{ }^{2} b^{2}+2 a_{1} a b_{2} b+4 a^{2} a_{1}{ }^{2}\right)\)
\((m, n, p, q, r, t)=(3,2,-4,3,2,2)\)
\(-240 a_{1} a c_{2}\left(5 c_{2}{ }^{2}+15 a^{2} a_{1}{ }^{2}+2 b a_{1} a b_{2}+b_{2}{ }^{2} b^{2}\right)^{*}\left(3 c_{2}{ }^{2}+5 a^{2} a_{1}{ }^{2}-2 b a_{1} a b_{2}-b_{2}{ }^{2} b^{2}\right)\)
\((m, n, p, q, r, t)=(3,3,-5,3,2,2)\)
\(-240 a_{1} a c_{2}\left(3 c_{2}{ }^{2}-b_{2}{ }^{2} b^{2} 2 a_{1} a b_{2} b+12 a_{1}{ }^{2} a^{2}\right)^{*}\left(5 c_{2}{ }^{2}+b_{2}{ }^{2} b^{2}+2 a_{1} a b_{2} b+22 a_{1}{ }^{2} a^{2}\right)\)
\((m, n, p, q, r, t)=(3,4,-6,3,2,2)\)
\(-240 a_{1} a c_{2}\left(3 c_{2}{ }^{2}+21 a_{1}{ }^{2} a^{2}-2 b_{2} a_{1} b a-b_{2}{ }^{2} b^{2}\right)^{*}\left(5 c_{2}{ }^{2}+31 a_{1}{ }^{2} a^{2}+2 b_{2} a_{1} b a+b_{2}{ }^{2} b^{2}\right)\)
```

    Take \(\mathrm{c}_{2}=1\)
    Case 1. \(\quad 4 a^{2} a_{1}{ }^{2}+2 a_{1} b_{2} b a+b_{2}{ }^{2} b^{2}=19\).
    We can find infinitely many rational solutions of (3), then we obtain infinitely parameter solutions of (2).

Take $x=2 a_{1} a, \quad y=b_{2} b$
Then (3) becomes to $x^{2}+x y+y^{2}=19$.
$(x, y)=(3,2)$ is a solution of (4).
We obtain parameter solution of $(3)$ by using $(a, b)=\left(3 /\left(2 a_{1}\right), 2 / b_{2}\right)$. And ' $k$ ' is parameter.

$$
\begin{aligned}
& A_{1}=7 k^{2} b_{2}^{2}-4 a_{1}^{2} \\
& A_{2}=-9 k^{2} b_{2}^{2}-32 k b_{2} a_{1}-68 a_{1}{ }^{2} \\
& A_{3}=3 k^{2} b_{2}^{2}+20 k b_{2} a_{1}+44 a_{1}{ }^{2}
\end{aligned}
$$

$$
\begin{aligned}
& A_{4}=15 k^{2} b_{2}{ }^{2}+20 k b_{2} a_{1}-28 a_{1}{ }^{2} \\
& A_{5}=11 k^{2} b_{2}^{2}-20 k b_{2} a_{1}-52 a_{1}{ }^{2} \\
& A_{6}=k^{2} b_{2}^{2}-44 k b_{2} a_{1}-36 a_{1}{ }^{2} \\
& B_{1}=-k^{2} b_{2}{ }^{2}-16 k b_{2} a_{1}-36 a_{1}{ }^{2} \\
& B_{2}=15 k^{2} b_{2}{ }^{2}+16 k b_{2} a_{1}+28 a_{1}{ }^{2} \\
& B_{3}=-9 k^{2} b_{2}^{2}-4 k b_{2} a_{1}-4 a_{1}{ }^{2} \\
& B_{4}=11 k^{2} b_{2}{ }^{2}+12 k b_{2} a_{1}-44 a_{1}{ }^{2} \\
& B_{5}=7 k^{2} b_{2}{ }^{2}-28 k b_{2} a_{1}-68 a_{1}{ }^{2} \\
& B_{6}=-3 k^{2} b_{2}^{2}-52 k b_{2} a_{1}-52 a_{1}{ }^{2}
\end{aligned}
$$

Example,

$$
\left(\mathrm{a}_{1}, \mathrm{~b}_{2}\right)=(1,1) \text { and }(\mathrm{k}=1)
$$

a) $3^{6}+109^{6}+67^{6}+7^{6}+61^{6}+79^{6}=$

$$
53^{6}+59^{6}+17^{6}+21^{6}+89^{6}+107^{6}
$$

b) $59^{6}+245^{6}+131^{6}+167^{6}+13^{6}+159^{6}=$

$$
93^{6}+211^{6}+97^{6}+91^{6}+89^{6}+235^{6}
$$

c) $27^{6}+85^{6}+43^{6}+73^{6}+11^{6}+49^{6}=$

$$
29^{6}+83^{6}+41^{6}+45^{6}+17^{6}+77^{6}
$$

## Degree Seven, $\mathrm{n}=7$,

Let,

$$
\begin{align*}
& x_{1}^{k}+x_{2}^{k}+x_{3}^{k}+x_{4}^{k}+x_{5}^{k}+x_{6}^{k}= \\
&  \tag{1}\\
& y_{1}^{k}+y_{2}^{k}+y_{3}^{k}+y_{4}^{k}+y_{5}^{k}+y_{6}^{k}
\end{align*}
$$

We show that,
for $k=1,3,5,7$ eqn. (1) has infinitely many integer solutions.
We used the below identity and Theorem.

Identity (Tito Piezas) (Ref.no.10).
$(c+b p+a q)^{k}+(c-b p-a q)^{k}+(d+a p-b q)^{k}+(d-a p+b q)^{k}=(c+b p-$ $a q)^{k}+(c-b p+a q)^{k}+(d+a p+b q)^{k}+(d-a p-b q)^{k}$,
for $\mathrm{k}=2,4,6$,
where $\left(4 q^{2}-p^{2}\right) b^{2}+\left(4 p^{2}-q^{2}\right) a^{2}=15 c^{2}$

$$
\text { and }\left(4 p^{2}-q^{2}\right) b^{2}+\left(4 q^{2}-p^{2}\right) a^{2}=15 d^{2}
$$

Theorem,

If $a_{1} \wedge^{\mathrm{k}}+a_{2} \wedge^{\wedge} \mathrm{k}+\ldots \ldots \ldots . .+a_{m}^{\wedge} \mathrm{k}=b_{1} \wedge \mathrm{k}+b_{2} \wedge \mathrm{k}+\ldots . . . . . . . .+b_{m} \wedge^{\wedge} \mathrm{k}$, for $\mathrm{k}=2,4, \ldots 2 \mathrm{n}$, then(using $t$ ) we get,

$$
\begin{aligned}
& \left(t+a_{1}\right)^{k}+\left(t+a_{2}\right)^{k}+\cdots+\left(t+a_{m}\right)^{k},\left(t-a_{1}\right)^{k}+\left(t-a_{2}\right)^{k}+\cdots+\left(t-a_{m}\right)^{k}= \\
& \left(t+b_{1}\right)^{k}+\left(t+b_{2}\right)^{k}+\cdots+\left(t+b_{m}\right)^{k},\left(t-b_{1}\right)^{k}+\left(t-b_{2}\right)^{k}+\cdots+\left(t-b_{m}\right)^{k}
\end{aligned}
$$

for $k=1,2,3, \ldots 2 n+1$, where $t$ is arbitrary integer.
where $\left(4 q^{2}-p^{2}\right) b^{2}+\left(4 p^{2}-q^{2}\right) a^{2}=15 c^{2}$

$$
\text { and }\left(4 p^{2}-q^{2}\right) b^{2}+\left(4 q^{2}-p^{2}\right) a^{2}=15 d^{2}
$$

Above for $k=1,3,5,7$ has infinite many solutions,

$$
\begin{array}{ll}
x_{1}=-c+d+a p-b q & y_{1}=-c+d+a p+b q \\
x_{2}=-c+d-a p+b q & y_{2}=-c+d-a p-b q \\
x_{3}=-2 c-b p-a q & y_{3}=-2 c-b p+a q \\
x_{4}=-2 c+b p+a q & y_{4}=-2 c+b p-a q \\
x_{5}=-c-d-a p+b q & y_{5}=-c-d-a p-b q \\
x_{6}=-c-d+a p-b q & y_{6}=-c-d+a p+b q
\end{array}
$$

We have,

$$
\begin{align*}
& x_{1}^{k}+x_{2}^{k}+x_{3}^{k}+x_{4}^{k}+x_{5}^{k}+x_{6}^{k}= \\
& \quad y_{1}^{k}+y_{2}^{k}+y_{3}^{k}+y_{4}^{k}+y_{5}^{k}+y_{6}^{k} \tag{1}
\end{align*}
$$

Let $\left[a_{1}, a_{2}, \ldots, a_{m}\right]=\left[b_{1} b_{2}, \ldots, b_{m}\right] \quad(\mathrm{k}=1,2, \ldots, \mathrm{n})$ denote
$a_{1} \wedge \mathrm{k}+a_{2} \wedge \mathrm{k}+\ldots \ldots \ldots . .+a_{m} \wedge \mathrm{k}=b_{1} \wedge \mathrm{k}+b_{2} \wedge \mathrm{k}+\ldots . . . . . . . .+b_{m} \wedge^{\wedge} \quad(\mathrm{k}=1,2, \ldots, \mathrm{n})$.
First we apply Tito Piezas's identity to above theorem, we obtain (using t)

$$
\begin{gathered}
{[t+c+b p+a q, t+c-b p-a q, t+d+a p-b q, t+d-a p+b q, t-c-b p-a q, t-c} \\
+b p+a q, t-d-a p+b q, t-d+a p-b q]^{k}=
\end{gathered}
$$

$$
\begin{gathered}
{[t+c+b p-a q, t+c-b p+a q, t+d+a p+b q, t+d-a p-b q, t-c-b p+a q, t-c} \\
+b p-a q, t-d-a p-b q, t-d+a p+b q]^{k}
\end{gathered}
$$

where $\left(4 q^{2}-p^{2}\right) b^{2}+\left(4 p^{2}-q^{2}\right) a^{2}=15 c^{2}$

$$
\text { and }\left(4 p^{2}-q^{2}\right) b^{2}+\left(4 q^{2}-p^{2}\right) a^{2}=15 d^{2}
$$

for $k=1,3,5,7$,
Here, set $t=(-c)$, we can reduce four terms and obtain

$$
[-c+d+a p-b q,-c+d-a p+b q,-2 c-b p-a q,-2 c+b p+a q,-c-d-a p
$$

$$
+b q,-c-d+a p-b q]^{k}=
$$

$[-c+d+a p+b q,-c+d-a p-b q,-2 c-b p+a q,-2 c+b p-a q,-c-d-a p-$ $b q,-c-d+a p+b q]^{k}$,
for $\mathrm{k}=1,3,5,7$
where $\left(4 q^{2}-p^{2}\right) b^{2}+\left(4 p^{2}-q^{2}\right) a^{2}=15 c^{2}$ and $\left(4 p^{2}-q^{2}\right) b^{2}+\left(4 q^{2}-p^{2}\right) a^{2}=15 d^{2}$

By transform simultaneous equation $\left\{\left(4 q^{2}-p^{2}\right) b^{2}+\left(4 p^{2}-q^{2}\right) a^{2}=15 c^{2}\right.$,

$$
\left.\left(4 p^{2}-q^{2}\right) b^{2}+\left(4 q^{2}-p^{2}\right) a^{2}=15 d^{2}\right\} \text { to an elliptic curve, }
$$

we can prove the infinity of solutions to this equation.
Since Tito Piezas's identity has infinitely many integer solutions, therefore this identity also has infinitely many integer solutions.

Example,
$(\mathrm{p}, \mathrm{q})=(3,2)$

$$
\begin{aligned}
& {[-c+d+3 a-2 b,-c+d-3 a+2 b,-2 c-3 b-2 a,-2 c+3 b+2 a,-c-d-3 a} \\
& \quad+2 b,-c-d+3 a-2 b]^{k}= \\
& {[-c+d+3 a+2 b,-c+d-3 a-2 b,-2 c-3 b+2 a,-2 c+3 b-2 a,-c-d-3 a} \\
& -2 b,-c-d+3 a+2 b]^{k}
\end{aligned}
$$

for $k=1,3,5,7$
where,

$$
\begin{gathered}
7 b^{2}+32 a^{2}=15 c^{2} \\
32 b^{2}+7 a^{2}=15 d^{2}
\end{gathered}
$$

and

Numerical example,

$$
\begin{aligned}
\{a, b, c, d\}= & \{1,13,9,19\}: \\
& {[-13,33,-59,23,-5,-51]^{k}=[39,-19,-55,19,-57,1]^{k} }
\end{aligned}
$$

$$
\begin{gathered}
\{a, b, c, d\}=\{466,607,797,942\}: \\
{[329,-39,-4347,1159,-1923,-1555]^{k}=[2757,-2467,-2483,-705,-4351,873]^{k}} \\
\{a, b, c, d\}=\{607,466,942,797\}: \\
{[372,-517,-2248,364,-1314,-425]^{k}=[1304,-1449,-1034,-850,-2246,507]^{k}}
\end{gathered}
$$

$(p, q)=(4,1)$

$$
[-c+d+4 a-b,-c+d-4 a+b,-2 c-4 b-a,-2 c+4 b+a,-c-d-4 a+b,-c-
$$

$$
d+4 a-b]^{k}=
$$

$$
\begin{gathered}
{[-c+d+4 a+b,-c+d-4 a-b,-2 c-4 b+a,-2 c+4 b-a,-c-d-4 a-b,-c} \\
\quad-d+4 a+b]^{k}
\end{gathered}
$$

for $k=1,3,5,7$

> where,

$$
\begin{aligned}
& \left(-12 b^{2}+63 a^{2}\right)=15 c^{2} \\
& \quad \text { and } 63 b^{2}-12 a^{2}=15 d^{2}
\end{aligned}
$$

One Solution is,

$$
\{a, b, c, d\}=\{89,82,167,148\}:
$$

$x_{1}^{k}+x_{2}^{k}+x_{3}^{k}+x_{4}^{k}+x_{5}^{k}+x_{6}^{k}=$

$$
y_{1}^{k}+y_{2}^{k}+y_{3}^{k}+y_{4}^{k}+y_{5}^{k}+y_{6}^{k}
$$

For $\mathrm{k}=7$, we get:

$$
[255,457,573,83,95,753]^{7}=[419,293,751,589,41,123]^{7}
$$

Second solution is,

$$
\begin{gathered}
\{a, b, c, d\}=\{82,89,148,167\}: \\
{[129,199,285,71,11,366]^{7}=[218,110,367,277,38,51]^{7}}
\end{gathered}
$$

## Degree eight, $n=8$,

$$
a^{8}+b^{8}+c^{8}+d^{8}+e^{8}+f^{8}=p^{8}+q^{8}+r^{8}+s^{8}+t^{8}+u^{8}
$$

There are many solutions for $\mathrm{A}_{1}{ }^{8}+\mathrm{A}_{2}{ }^{8}+\mathrm{A}_{3}{ }^{8}+\mathrm{A}_{4}{ }^{8}+\mathrm{A}_{5}{ }^{8}+\mathrm{A}_{6}{ }^{8}=\mathrm{B}_{1}{ }^{8}+\mathrm{B}_{2}{ }^{8}+\mathrm{B}_{3}{ }^{8}+\mathrm{B}_{4}{ }^{8}+\mathrm{B}_{5}{ }^{8}+\mathrm{B}_{6}{ }^{8}$.
We show that there are infinitely many solutions for 8.6.6 by Sinha's Theorem.
By Sinha's Theorem,
$\mathrm{A}_{1}^{8}+\mathrm{A}_{2}^{8}+\mathrm{A}_{3}{ }^{8}+\mathrm{A}_{4}^{8}+\mathrm{A}_{5}^{8}+\mathrm{A}_{6}^{8}+\mathrm{A}_{7}^{8}=\mathrm{B}_{1}^{8}+\mathrm{B}_{2}^{8}+\mathrm{B}_{3}^{8}+\mathrm{B}_{4}^{8}+\mathrm{B}_{5}^{8}+\mathrm{B}_{6}^{8}+\mathrm{B}_{7}^{8}$.
But, if we set $\left(A_{1}+B_{1}=0\right)$, we can obtain the solution for (8.6.6) equation.

## Theorem

There are infinitely many solutions for $\mathrm{A}_{1}^{8}+\mathrm{A}_{2}{ }^{8}+\mathrm{A}_{3}{ }^{8}+\mathrm{A}_{4}{ }^{8}+\mathrm{A}_{5}^{8}+\mathrm{A}_{6}{ }^{8}=$

$$
\mathrm{B}_{1}{ }^{8}+\mathrm{B}_{2}{ }^{8}+\mathrm{B}_{3}{ }^{8}+\mathrm{B}_{4}{ }^{8}+\mathrm{B}_{5}{ }^{8}+\mathrm{B}_{6}{ }^{8} .
$$

1. Solving for $a_{1}^{2}+a_{2}^{2}+a_{3}^{2}=b_{1}^{2}+b_{2}^{2}+b_{3}^{2}$.

$$
\begin{align*}
& \text { Set } a_{1}=a(x)+s_{1}, a_{2}=b(x)+s_{2}, a_{3}=b(x)+s_{2}-3\left(a x+s_{1}\right), \\
& \qquad b_{1}=a(x)-s_{2}, b_{2}=b(x)-s_{1}, b_{3}=(b-3 a) x-s_{2}+3 s_{1} \ldots \ldots . \tag{1}
\end{align*}
$$

Take $s_{1}=5 a-3 b, s_{2}=19 a-5 b$ then

$$
a_{1}^{2}+a_{2}^{2}+a_{3}^{2}-\left(b_{1}^{2}+b_{2}^{2}+b_{3}^{2}\right)=0
$$

2. Solving for $\mathrm{a}_{1}{ }^{4}+\mathrm{a}_{2}{ }^{4}+\mathrm{a}_{3}{ }^{4}=\mathrm{b}_{1}{ }^{4}+\mathrm{b}_{2}{ }^{4}+\mathrm{b}_{3}{ }^{4}$.

$$
\begin{aligned}
& a_{1}^{4}+a_{2}^{4}+a_{3}^{4}-\left(b_{1}^{4}+b_{2}^{4}+b_{3}^{4}\right)=-32 x(a+b)(3 a-b)^{*} f \\
& f=\left(8 x^{2}+21 x-275\right)^{*} a^{2}+\left(-5 x^{2}-24 x+170\right) * a b+(3 x-3) b^{2}
\end{aligned}
$$

We must find rational value $(a, b)$ for above equation.
Discriminant,

$$
\begin{equation*}
25 x^{4}+144 x^{3}-1280 x^{2}-4608 x+25600=y^{2} \tag{2}
\end{equation*}
$$

So, we must find rational numbers $x, y$.
$\mathrm{U}=\mathrm{x}$ and $\mathrm{V}=\mathrm{y}$
$V^{2}=25 U^{4}+144 U^{3}-1280 U^{2}-4608 U+25600$.
Using elliptic curve theory, and using 'APECS' program by lan Connell, Weierstrass form is,

$$
\begin{equation*}
Y^{2}=X^{3}+X^{2}-920 X+10404 . \tag{4}
\end{equation*}
$$

$U=(200 X-3248) /(5 Y+9 X-162)$
$V=\left(25344 Y-194880 X^{2}+3550080 X-23468800+4000 X^{3}\right) /(5 Y+9 X 162)^{2}$.
$\mathrm{X}=\left(5 \mathrm{~V}+800-72 \mathrm{U}-7 \mathrm{U}^{2}\right) / \mathrm{U}^{2}$
$Y=\left(200 V+32000-4320 U-800 U^{2}-9 V U+45 U^{3}\right) / U^{3}$.
Point $P=(0,160)$ solution for (3).
Rational point $Q(X, Y)$ on the curve (4) corresponding to the values $U=0, V=160$ is $\mathrm{X}=406 / 25, \mathrm{Y}=-396 / 125$.

So, we get the relation of the curve (3) and the curve (4).
Point, $(P)=(0,160)$ on the curve (3), Point, $(Q)=(406 / 25,-396 / 125)$ on the curve (4)

We obtain $2 \mathrm{Q}=(4939 / 25,-344112 / 125)$ on the curve (4) using APECS.

As this point on the curve (4) does not have integer coordinates, there are infinitely many rational points on the curve (4) by Nagell-Lutz theorem.

Point, ( 2P $)=(-200 / 67,725280 / 4489)$ is given by 2 Q using (5).

We can obtain infinitely many integer solutions for (2) by applying the group law.
By Sinha's Theorem,

$$
\mathrm{A}_{1}^{8}+\mathrm{A}_{2}^{8}+\mathrm{A}_{3}^{8}+\mathrm{A}_{4}^{8}+\mathrm{A}_{5}^{8}+\mathrm{A}_{6}^{8}+\mathrm{A}_{7}^{8}=
$$

$$
\begin{equation*}
\mathrm{B}_{1}^{8}+\mathrm{B}_{2}^{8}+\mathrm{B}_{3}^{8}+\mathrm{B}_{4}^{8}+\mathrm{B}_{5}^{8}+\mathrm{B}_{6}^{8}+\mathrm{B}_{7}^{8} \tag{1}
\end{equation*}
$$

$$
\begin{aligned}
& \mathrm{A}_{1}=2 a_{1} \\
& \mathrm{~A}_{2}=2 a_{2} \\
& \mathrm{~A}_{3}=\mathrm{b}_{1}+\mathrm{b}_{2}+\mathrm{b}_{3} \\
& \mathrm{~A}_{4}=2 a_{3} \\
& \mathrm{~A}_{5}=\mathrm{b}_{1}-\mathrm{b}_{2}+\mathrm{b}_{3} \\
& \mathrm{~A}_{6}=-\mathrm{b}_{1}+\mathrm{b}_{2}+\mathrm{b}_{3} \\
& \mathrm{~A}_{7}=\mathrm{b}_{1}+\mathrm{b}_{2}-\mathrm{b}_{3} \\
& \\
& \mathrm{~B}_{1}=\mathrm{a}_{1}-\mathrm{a}_{2}+\mathrm{a}_{3} \\
& \mathrm{~B}_{2}=-\mathrm{a}_{1}+\mathrm{a}_{2}+\mathrm{a}_{3} \\
& \mathrm{~B}_{3}=2 \mathrm{~b}_{3} \\
& \mathrm{~B}_{4}=a_{1}+a_{2}+a_{3} \\
& \mathrm{~B}_{5}=2 \mathrm{~b}_{1} \\
& \mathrm{~B}_{6}=2 \mathrm{~b}_{2} \\
& \mathrm{~B}_{7}=a_{1}+a_{2}-a_{3}
\end{aligned}
$$

By Sinha's Theorem, substitute ( $a, b, x$ ) to (1), then
we obtain infinitely many solutions of (1).
Example,
$(x, a, b):\left(8 x^{2}+21 x-275\right) a^{2}+\left(-5 x^{2}-24 x+170\right)^{*} a b+(3 x-3) b^{2}=0$
Since, $a_{1}=a x+s_{1}, a_{2}=b x+s_{2}, a_{3}=b x+s_{2}-3\left(a x+s_{1}\right), b_{1}=a x-s_{2}, b_{2}=b x-s_{3}$, $b_{3}=(b-3 a) x-s_{2}+3 s_{1}$.
and, $s_{1}=5 a-3 b, s_{2}=19 a-5 b$ then
For, $(x, a, b)=(1,47,82)$ we get after substituting values of ( $a_{1}, a_{2}, a_{3}, b_{1}, b_{2}, b_{3}$ ) in equation (2) and equation (1) above,

$$
\begin{aligned}
& 565^{8}+459^{8}+457^{8}+552^{8}+23^{8}+116^{8}= \\
& 493^{8}+575^{8}+529^{8}+436^{8}+93^{8}+72^{8} \\
& (x, a, b)=(-6,21,113) \\
& 211^{8}+155^{8}+59^{8}+44^{8}+165^{8}+54^{8}= \\
& 31^{8}+209^{8}+121^{8}+10^{8}+111^{8}+180^{8}
\end{aligned}
$$

$(x, a, b)=(6,15,139)$

$$
\begin{aligned}
& 106^{8}+203^{8}+295^{8}+91^{8}+78^{8}+216^{8}= \\
& 232^{8}+13^{8}+169^{8}+125^{8}+294^{8}+126^{8}
\end{aligned}
$$

$(x, a, b)=(-14,5,9)$

$$
\begin{aligned}
& 19^{8}+27^{8}+35^{8}+4^{8}+3^{8}+34^{8}= \\
& 17^{8}+7^{8}+1^{8}+30^{8}+31^{8}+36^{8}
\end{aligned}
$$

$$
(x, a, b)=(-14,3,-37)
$$

$$
\begin{aligned}
& 190^{8}+111^{8}+127^{8}+13^{8}+182^{8}+84^{8}= \\
& 148^{8}+195^{8}+169^{8}+71^{8}+98^{8}+42^{8}
\end{aligned}
$$

## Degree nine , $n=9$,

$$
\begin{aligned}
& x_{1}^{9}+x_{2}^{9}+x_{3}^{9}+x_{4}^{9}+x_{5}^{9}+ x_{6}^{9}= \\
& y_{1}^{9}+y_{2}^{9}+y_{3}^{9}+y_{4}^{9}+y_{5}^{9}+y_{6}^{9}
\end{aligned}
$$

Andrew Bremner and J. Delorme (Ref. no. 1) showed that,

$$
x_{1}^{k}+x_{2}^{k}+x_{3}^{k}+x_{4}^{k}+x_{5}^{k}+x_{5}^{k}=y_{1}^{k}+y_{2}^{k}+y_{3}^{k}+y_{4}^{k}+y_{5}^{k}+y_{6}^{k}
$$

for $k=1,2,3,9$ has infinitely many integer solutions.([1])

By differrent way, Tito Piezas [10] showed that above equation has infinitely many solutions.
A.Choudhry (Ref. no. 11) showed that $x_{1}^{k}+x_{2}^{k}+x_{3}^{k}=y_{1}^{k}+y_{2}^{k}+y_{3}^{k}$
for $\mathrm{k}=1,2,6$ has infinitely many integer solutions ([3])
We show that there are infinity many solutions for above (k.6.6) equation.

$$
\begin{align*}
x_{1}^{k}+x_{2}^{k}+x_{3}^{k}+x_{4}^{k}+x_{5}^{k}+x_{6}^{k} & = \\
y_{1}^{k}+y_{2}^{k} & +y_{3}^{k}+y_{4}^{k}+y_{5}^{k}+y_{6}^{k} \tag{2}
\end{align*}
$$

for $k=1,2,3,9$ has infinitely many solutions.

Set variables as following [equation (3)],

$$
\begin{array}{ll}
x_{1}=2(a+b) m+(a-b+t) n+w & y_{1}=2(a+b) m+(a-b+t) n-w \\
x_{2}=-2 a m+(a+b+t) n+w & y_{2}=-2 a m+(a+b+t) n-w \\
x_{3}=-2 b m-(a+b-t) n+w & y_{3}=-2 b m-(a+b-t) n-w \\
x_{4}=-2(a+b) m+(a-b+t) n-w & y_{4}=-2(a+b) m+(a-b+t) n+w \\
x_{5}=2 a m+(a+b+t) n-w & y_{5}=2 a m+(a+b+t) n+w \\
x_{6}=2 b m-(a+b-t) n-w & y_{6}=2 b m-(a+b-t) n+w
\end{array}
$$

By using Ajai Choudhry's [Ref. no.11], equation (2) is always equals to zero for degree $k=1,2,3$.

And for $\mathrm{k}=9$ we have :

$$
x_{1}^{9}+x_{2}^{9}+x_{3}^{9}+x_{4}^{9}+x_{5}^{9}+x_{6}^{9}=y_{1}^{9}+y_{2}^{9}+y_{3}^{9}+y_{4}^{9}+y_{5}^{9}+y_{6}^{9}
$$

Substituting values of above from equation (3) and after simplification we get,

```
Expression \(=18432 *{ }^{*}{ }^{*} \mathrm{~b}^{*} \mathrm{~m} * n^{2}(\mathrm{~m}-\mathrm{n})(\mathrm{m}+\mathrm{n})(\mathrm{a}+\mathrm{b})(\mathrm{a}-\mathrm{b}+3 \mathrm{t})\)
    * \(\left(-5 m^{2} b^{3}-n^{2} b^{3}+7 m^{2} b^{2} t-4 m^{2} b^{2} a+7 n^{2} b^{2} t+2 n^{2} b^{2} a+7 a m^{2} t b+4 m^{2} b a^{2}\right.\)
    \(-14 n^{2} b t^{2}-2 n^{2} b a^{2}-7 a n^{2} b t+5 m^{2} a^{3}+7 m^{2} a^{2} t+7 n^{2} a^{2} t+14 n^{2} a t^{2}\)
    \(\left.+n^{2} a^{3}+14 n^{2} t^{3}\right)\)
    * \(\left(2 m^{2} b^{2}+2 m^{2} b a+2 m^{2} a^{2}+3 n^{2} a^{2}+14 n^{2} t a+21 n^{2} t^{2}-4 b n^{2} a-14 b n^{2} t+3 b^{2} n^{2}\right)\)
```

So, we have to find the rational solution ( $m, n$ ) of:
$\left(-14 b t^{2}-7 b a t+a^{3}+2 a b^{2}+14 a t^{2}-2 a^{2} b-b^{3}+7 a^{2} t+7 b^{2} t+14 t^{3}\right) n^{2}+$
$\left(-4 a b^{2}-5 b^{3}+4 a^{2} b+5 a^{3}+7 b^{2} t+7 a^{2} t+7 b a t\right) m^{2}=0$
$\left(-4 a b^{2}-5 b^{3}+4 a^{2} b+5 a^{3}+7 b^{2} t+7 a^{2} t+7 b a t\right) m^{2}=0$.
So that there are rational solution,

$$
\begin{gathered}
-\left(-14 b t^{2}-7 b a t+a^{3}+2 a b^{2}+14 a t^{2}-2 a^{2} b-b^{3}+7 a^{2} t+7 b^{2} t+14 t^{3}\right) \\
*\left(-4 a b^{2}-5 b^{3}+4 a^{2} b+5 a^{3}+7 b^{2} t+7 a^{2} t+7 b a t\right)
\end{gathered}
$$

must be square number $\left(s^{2}\right)$, then we have to find rational solution $(\mathrm{a}, \mathrm{b}, \mathrm{t}, \mathrm{s})$ of

$$
\begin{gather*}
s^{2}= \\
\left(-98 a^{2}-98 a b-98 b^{2}\right) t^{4}+\left(56 a b^{2}-56 a^{2} b+168 b^{3}-168 a^{3}\right) t^{3} \\
+\left(63 a^{2} b^{2}-119 a^{4}+14 a b^{3}-119 b^{4}+14 a^{3} b\right) t^{2} \\
+\left(14 a^{3} b^{2}-14 a^{2} b^{3}-42 a^{5}+42 b^{5}-14 a b^{4}+14 a^{4} b\right) t \\
+6 a b^{5}+6 a^{5} b-5 a^{6}+2 a^{4} b^{2}-5 b^{6}-6 a^{3} b^{3}+2 a^{2} b^{4} \ldots \tag{4}
\end{gather*}
$$

By computer search, we found a solution ( $a, b, t)=(3,4,27 / 41)$.
Substitute (a, b, t)=(3, 4, 27/41) to (3), then (3) becomes to 160/68921(139n$164 m)(139 n+164 m)=0$.

So, we get $(m, n)=(139,164)$.
Substitute (a, b, t, m, n) $=(3,4,27 / 41,139,164)$ to (2), then we get following solution,
[x1, x2, x3, x4, x5, x6] = [1025, 291, -996, -1081, 965, -44]
[y1, y2, y3, y4, y5, y6] = [865, 131,-1156, -921, 1125, 116].

Next, substitute,
$(a, b)=(3,4)$ to $(4)$,then we get a quartic equation,
$s^{2}=-3626 * t^{\wedge} 4+6888^{*} \mathrm{t}^{\wedge} 3-26831 * \mathrm{t}^{\wedge} 2+24570 * \mathrm{t}-3029$ $\qquad$

Using elliptic curve theory, transform (5) to minimal Weierstrass form (6).
$V^{2}+U V+V=U^{3}-7166374-22875861928$.

We get a point $P(U, V)=(1026337 / 64,-1026359837 / 512)$.

As this point on the curve (6) does not have integer coordinates, there are infinitely many rational points on the curve (6) by Nagell-Lutz theorem.

By using point 2P=(t,s)=(3181201/12876603, 6408411316637440/165806904819609), we obtain a new solution.
[ $x 1, x 2, x 3, x 4, x 5, x 6]=$
[15677071397, 40208111671,-63297775068,-26458358421, 63560861593,-33396207172]
[y1, y2, y3, y4, y5, y6] =
[19383367397, 43914407671, -59591479068,-30164654421, 59854565593,-37102503172]
Example,
$[a, b, t]=[1,3,6 / 5]$,

$$
[18,13,14,23,13,1]^{9}=[5,10,15,21,22,9]^{9}
$$

$[a, b, t]=[4,9,13 / 3]$,

$$
[453,122,331,431,150,281]^{9}=[429,98,307,455,174,305]^{9}
$$

## Table (A):

(six) $n^{\text {th }}$ powers equal to another $(s i x) n^{\text {th }}$ powers :

$$
\left[a^{n}+b^{n}+c^{n}+d^{n}+e^{n}+f^{n}\right]=\left[p^{n}+q^{n}+r^{n}+s^{n}+t^{n}+u^{n}\right]
$$

Numerical solutions: For degree's $n=2,3,4,5,6,7,8 \& 9$

| n | a | b | c | d | e | f |  | p | q | r | s | t | u |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | 1 | 7 | 17 | 30 | 31 | 36 | $=$ | 3 | 4 | 19 | 27 | 34 | 35 |
